

Algorithms 1-3 present the detailed pseudocode outlining our proposed SCALA pipeline for Intelligent Fault Resolution.

---

**Algorithm 1** GenerateKB

---

```

1: Input: Fault log corpus  $\mathcal{F}$ 
2: Output: Augmented fault log knowledge base  $\mathcal{K}$ 
3: /* Encoder Stage */
4: Fine-tune MiniLM encoder  $E$  using corpus  $\mathcal{F}$ 
5: Extract fault embeddings  $\mathcal{E} = \{e_i = E(f_i)\}_{i=1}^N$  where  $f_i \in \mathcal{F}$  and  $e_i \in \mathbb{R}^{384}$ 
6: /* MAD-GAN Stage */
7: Initialize  $K$  generators  $\{G_1, G_2, \dots, G_K\}$  and one discriminator  $D$ 
8: for number of training epochs do
9:   Sample real embeddings  $e_i \in \mathcal{E}$ 
10:  for  $j = 1$  to  $K$  do
11:    Generate fake embedding  $\tilde{e}_j = G_j(z)$ ,  $z \sim \mathcal{N}(0, I)$ 
12:  end for
13:  Train  $D$  to (i) distinguish real vs fake, and (ii) identify generator  $G_j$  for  $\tilde{e}_j$ 
14:  Train each  $G_j$  to fool  $D$  into classifying  $\tilde{e}_j$  as real
15: end for
16: Trained Generator  $G$  produces synthetic embeddings  $\{\tilde{e}_j\}$ 
17: /* Decoder Stage */
18: Fine-tune GPT-2 decoder  $Dec$  using corpus  $\mathcal{F}$ 
19: Train a neural projector  $P: \mathbb{R}^{384} \rightarrow \mathbb{R}^{768}$  to map encoder space to decoder space
20: Freeze  $Dec$  weights and train projector  $P$  using pairs  $(e_i, f_i)$ 
21: Generate synthetic fault logs  $\tilde{f}_j = Dec(P(\tilde{e}_j))$ 
22:  $\mathcal{K} \leftarrow \mathcal{K} \cup \{(\tilde{f}_j)\}$ 
23: return  $\mathcal{K}$ 

```

---

---

**Algorithm 2** Intelligent Fault Resolution (Generator)

---

```

1: Input: New fault description  $f_{\text{new}}$  and retrieval size  $k$ 
2: Output: Context-aware resolution  $r_{\text{new}}$ 
3:  $\mathcal{K} \leftarrow \text{GenerateKB Algorithm}()$ 
4:  $\mathcal{C} \leftarrow \text{Perform GMM Clustering}(\mathcal{K})$ 
5:  $\text{new\_fault} \leftarrow f_{\text{new}}$ 
6:  $\text{new\_embed} \leftarrow \text{Fault Embedding}(\text{new\_fault})$ 
7:  $c^* \leftarrow \text{Cluster Prediction}(\text{new\_embed}, \mathcal{C})$ 
8:  $(\text{closer\_faults}, \text{corres\_resolutions}) \leftarrow$   

    $\text{GCFAlgorithm}(\text{new\_embed}, \mathcal{K}, c^*, k)$ 
9:  $\text{prompt} \leftarrow \text{ConstructPrompt}(\text{closer\_faults}, \text{corres\_resolutions}, \text{new\_fault})$ 
10:  $r_{\text{new}} \leftarrow \text{GPT}(\text{prompt})$ 
11: return  $r_{\text{new}}$ 

```

---

---

**Algorithm 3** Get Closer Faults (**GCF**) Retriever

---

```
1: function GET_CLOSER_FAULTS(new_embed,  $\mathcal{K}$ ,  $c^*$ ,  $k$ )
2:    $\mathcal{F}_{c^*} \leftarrow$  filter faults from  $\mathcal{K}$  belonging to cluster  $c^*$ 
3:   existing_faults  $\leftarrow$  fault descriptions from  $\mathcal{F}_{c^*}$ 
4:   existing_embed  $\leftarrow$  Fault Embedding(existing_faults)
5:   closer  $\leftarrow$  CosineSimilarity(new_embed, existing_embed)
6:   top_indices  $\leftarrow$  select indices of  $k$  closest faults
       with highest similarity scores
7:   closer_faults  $\leftarrow$  [existing_faults[j]
       for j in top_indices]
8:   corres_resolutions  $\leftarrow$  [resolution[j]
       for j in top_indices]
9:   return (closer_faults, corres_resolutions)
10: end function
```
